Asymptotic Notations

• Computational complexities are usually denoted using the following notations.

Definition 1.3.1. Big \mathcal{O} .

The function $f(n) = \mathcal{O}(g(n))$ if and only if there are positive constants c and n_0 such that $f(n) \leq c \cdot g(n)$ for all n, $n \geq n_0$.

- f(n) is bound above by g(n).
- Examples
 - $3n + 2 = \mathcal{O}(n)$,
 - $1000n^2 + 100n 6 = \mathcal{O}(n^2)$,
 - $6 \cdot 2^n + n^2 = \mathcal{O}(2^n)$.
- $\mathcal{O}(1)$ means the complexity is constant.
- $\mathcal{O}(n)$ is called linear.
- $\mathcal{O}(n^2)$ is called quadratic.
- $\mathcal{O}(n^3)$ is called cubic.
- $\mathcal{O}(2^n)$ is called exponential.

Asymptotic Notations, II

Theorem 1.3.2. Polynomial and \mathcal{O} .

If $f(n) = a_m n^m + \cdots + a_1 n + a_0$, then $f(n) = \mathcal{O}(n^m)$.

Proof.

$$f(n) \le \sum_{i=0}^{m} |a_i| n^i$$

$$= n^m \sum_{i=0}^{m} |a_i| n^{i-m}$$

$$\le n^m \sum_{i=0}^{m} |a_i| \qquad \text{for } n \ge 1.$$

Therefore, $f(n) \leq cn^m$ for $n \geq 1$ and $c = \sum |a_i|$, and by definition, $f(n) = \mathcal{O}(n^m)$.

• The following complexities are seen more often: $\mathcal{O}(1)$, $\mathcal{O}(\lg n)$, $\mathcal{O}(n)$, $\mathcal{O}(n \lg n)$, $\mathcal{O}(n^2)$, $\mathcal{O}(n^3)$, $\mathcal{O}(2^n)$.

Algorithms (Analysis II)

Unit 1.3 Analysis II

Mar. 17, 2020

3 / 22

Asymptotic Notations, III

Definition 1.3.3. Omega.

The function $f(n) = \Omega(g(n))$ if and only if there are positive constants c and n_0 such that $f(n) \ge c \cdot g(n)$ for all n, $n \ge n_0$.

- f(n) is bounded below by g(n).
- Example
 - $3n+2 \ge 3n$ for $n \ge 0$, thus $3n+2 = \Omega(n)$,
 - $10n^2 + 4n + 2 \ge 10n^2$ for $n \ge 0$, thus $10n^2 + 4n + 2 = \Omega(n^2)$,
 - $6 \cdot 2^n + n^2 = \Omega(2^n)$.
- Note that $10n^2 + 4n + 2 = \Omega(n)$ as well, but it is less informative to write so.
- Thus, we usually take the highest order g(n) in this notation.

Theorem 1.3.4.

If $f(n) = a_m n^m + \cdots + a_1 n + a_0$ and $a_m > 0$, then $f(n) = \Omega(n^m)$.

Asymptotic Notations, IV

Definition 1.3.5. Theta.

The function $f(n) = \Theta(g(n))$ if and only if there are positive constants c_1 , c_2 and n_0 such that $c_1 \cdot g(n) \leq f(n) \leq c_2 \cdot g(n)$ for all $n \geq n_0$.

- $f(n) = \Theta(g(n))$ if and only if g(n) is both an upper and lower bound on f(n).
- Example
 - $3n + 2 = \Theta(n)$,
 - $10n^2 + 4n + 2 = \Theta(n^2)$,
 - $6 \cdot 2^n + n^2 = \Theta(2^n)$.
 - $10 \lg n + 4 = \Theta(\lg n)$.

Theorem 1.3.6.

Given two functions f(n) and g(n), we have $f(n) = \Theta(g(n))$ if and only if $f(n) = \mathcal{O}(g(n))$ and $f(n) = \Omega(g(n))$.

Theorem 1.3.7.

If $f(n) = a_m n^m + \cdots + a_1 n + a_0$ and $a_m > 0$, then $f(n) = \Theta(n^m)$.

Algorithms (Analysis II)

Unit 1.3 Analysis I

Mar. 17, 2020

5 / 22

Asymptotic Notations, V

Definition 1.3.8. Little o.

The function f(n) = o(g(n)) if and only if

$$\lim_{n \to \infty} \frac{f(n)}{g(n)} = 0. \tag{1.3.1}$$

- Example
 - $3n+2=o(n^2)$,
 - $\bullet \ 3n+2=o(n\lg n),$
 - $\bullet \ 3n + 2 = o(n \lg \lg n),$
 - $6 \cdot 2^n + n^2 = o(3^n)$,
 - $6 \cdot 2^n + n^2 = o(2^n \lg n)$,

Definition 1.3.9. Little omega.

The function $f(n) = \omega(g(n))$ if and only if

$$\lim_{n \to \infty} \frac{g(n)}{f(n)} = 0. \tag{1.3.2}$$

Algorithms (Analysis II)

Unit 1.3 Analysis II

Properties of Asymptotic Notations

- The following properties hold for asymptotic notations.
- Transitivity:

```
f(n) = \Theta(q(n))
                      and
                             q(n) = \Theta(h(n))
                                                   then
                                                           f(n) = \Theta(h(n)),
f(n) = \mathcal{O}(g(n))
                      and
                             g(n) = \mathcal{O}(h(n))
                                                           f(n) = \mathcal{O}(h(n)),
                                                   then
f(n) = \Omega(g(n))
                      and
                             g(n) = \Omega(h(n))
                                                   then
                                                           f(n) = \Omega(h(n)),
                             q(n) = o(h(n))
f(n) = o(g(n))
                      and
                                                   then
                                                           f(n) = o(h(n)),
                             g(n) = \omega(h(n))
f(n) = \omega(g(n))
                                                           f(n) = \omega(h(n)).
                      and
                                                   then
```

Reflexivity:

$$f(n) = \Theta(f(n)),$$

$$f(n) = \mathcal{O}(f(n)),$$

$$f(n) = \Omega(f(n)).$$

Algorithms (Analysis II)

Unit 1.3 Analysis II

Mar. 17. 2020

7 / 22

Properties of Asymptotic Notations, II

• Symmetry:

$$f(n) = \Theta(g(n))$$
 if and only if $g(n) = \Theta(f(n))$.

• Transpose symmetry:

$$f(n) = \mathcal{O}(g(n))$$
 if and only if $g(n) = \Omega(f(n))$, $f(n) = o(g(n))$ if and only if $g(n) = \omega(f(n))$.

Definition 1.3.10. Asymptotic Comparisons.

Given two functions f(n) and g(n), f(n) is asymptotically smaller than g(n) if

$$f(n) = o(g(n)).$$
 (1.3.3)

And f(n) is asymptotically larger than g(n) if

$$f(n) = \omega(g(n)). \tag{1.3.4}$$

Complexity in Asymptotic Notations

• These notations can be applied to asymptotic complexity analysis.

Statement	s/e	freq.	Total steps
// Simple summation.			
1 Algorithm Sum (A, n)	0	_	0
2 {	0	_	0
Sum := 0;	1	1	$\Theta(1)$
4 for $i := 1$ to n do	1	n+1	$\Theta(n)$
Sum := Sum + A[i];	1	n	$\Theta(n)$
6 return Sum ;	1	1	$\Theta(1)$
7 }	0	_	0
Total			$\Theta(n)$

 Some details in calculating the exact execution steps can be ignored using these notations.

Algorithms (Analysis II)

Unit 1.3 Analysis II

Mar. 17, 2020

Complexity in Asymptotic Notations, II

Another example

Statement	s/e	freq.	total steps
$//$ $C := A + B$, all are $m \times n$ matrices.			
1 Algorithm MAdd (A, B, C, m, n)	0	_	0
2 {	0	_	0
3 for $i:=1$ to m do	1	$\Theta(m)$	$\Theta(m)$
for $j := 1$ to n do	1	$\Theta(mn)$	$\Theta(mn)$
	1	$\Theta(mn)$	$\Theta(mn)$
6 }	0	_	0
Total			$\Theta(mn)$

Note that we have used the following properties

$$\Theta(n) + \Theta(1) = \Theta(n),$$

$$\Theta(n) + \Theta(n) = \Theta(n).$$

$$\Theta(mn) + \Theta(m) = \Theta(mn).$$

Power Function

• To calculate x^n , where $n \ge 0$ is an integer.

Algorithm 1.3.11. Power

```
// Calculate x^n
// Input: x, int n \ge 0
// Output: x^n.

1 Algorithm Pow1(x, n)

2 {
3     result:= 1; // Initialize result
4     for i:= 1 to n do { // Step n times
5         result:= result × x; // Multiplication.
6     }
7     return result;
8 }
```

• This algorithm has computational complexity of $\Theta(n)$.

Algorithms (Analysis II)

Unit 1.3 Analysis II

Mar. 17, 2020

Mar. 17, 2020

11 / 2:

Power Function, II

Algorithm 1.3.12. Power – Improved

```
// Calculate x^n
   // Input: x, int n \ge 0
   // Output: x^n.
 1 Algorithm Pow(x, n)
 2 {
         m := n; result := 1; z := x; // Initialization
 3
         while (m > 0) do \{ // \text{Repeat} \}
 4
              while (m \mod 2 = 0) do \{ // \text{ Account for 2's power} \}
 5
                   m := m/2; z := z \times z;
 6
 7
              m := m-1; result := result \times z; // accumulate to result
 8
 9
10
         return result;
11 }
```

- This algorithm has computational complexity of $\Theta(\lg n)$.
- Asymptotic analysis enables comparison of different algorithms.

Power Function Execution

• Example of Pow(x,7) function execution

```
3
        m := 7; result := 1; z := x;
        while m > 0
4
5
             while m \mod 2 = 1
8
             m := m - 1 = 6; result := result \times z = x;
4
        while m > 0
             while m \mod 2 = 0
5
6
                 m = 3: z = z \times z = x^2:
             while m \mod 2 = 1
5
             m:=m-1=2; result:=result\times z=x^3;
8
4
        while m > 0
             while m \mod 2 = 0
5
                 m = 1; z = z \times z = x^4;
6
             while m \mod 2 = 1
5
             m:=m-1=0; result:=result\times z=x^7;
8
        while m=0
10 return result = x^7:
```

• Line 5 while loop executed $2 \times \lceil \lg n \rceil$ times.

Algorithms (Analysis II)

Unit 1.3 Analysis II

13/2

Comparing Algorithms

• It can be shown that Pow1 algorithm has the asymptotic computational complexity of $\Theta(n)$,

$$\exists c_1, c_2, n_1$$
, such that $c_1 \cdot n \leq t_{\mathsf{Pow}1} \leq c_2 \cdot n$ for $n \geq n_1$.

• While Pow algorithm is $\Theta(\lg n)$,

$$\exists d_1, d_2, n_2$$
, such that $d_1 \cdot \lg n \leq t_{Pow} \leq d_2 \cdot \lg n$ for $n \geq n_2$.

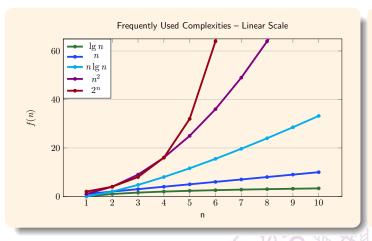

• Since $\lg n < n$ for n > 1,

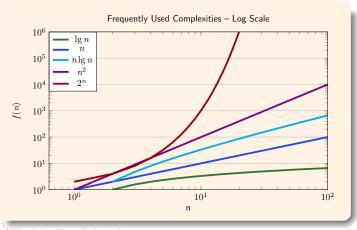

$$t_{Pow} < t_{Pow1} \text{ for } n > \max\{n_1, n_2\}.$$

- Thus, Pow function is more efficient than Pow1.
- Frequently used asymptotic complexities

$\lg n$	$\mid n \mid$	$n \lg n$	n^2	n^3	2^n
0	1	0	1	1	2
1	2	2	4	8	4
2	4	8	16	64	16
3	8	24	64	512	256
4	16	64	256	4,096	65,536
5	32	160	1,024	32,768	4,294,967,296

Comparing Algorithms, II

- Linear scale plot
 - $\lg n$, n and $n \lg n$ appear to be tractable.
 - n^2 and 2^n grow quickly.
- Log scale plot
 - More useful for asymptotic complexity comparisons.
 - Most curves appear to be straight lines (even $\lg n$ and $n \lg n$).
 - 2^n , exponential curves, increase too fast to be tractable.

Algorithms (Analysis II)

Unit 1.3 Analysis II

Comparing Algorithms, III

Execution Time							
n	t(n)	$t(n \lg n)$	$t(n^2)$	$t(n^3)$	$t(n^4)$	$t(n^{10})$	$t(2^n)$

Units: μ s: 10^{-6} seconds: ms: 10^{-3} seconds: s: seconds: m: minutes: h: hours: d: days: v: years.							

- ullet Assuming 10^9 operations per second can be performed
- Higher complexity algorithms can not handle large amount of data.
- Improving computer operation speed has limited benefits.
- Algorithm's complexity is of critical importance for practical programming.

Algorithms (Analysis II) Unit 1.3 Analysis II

Performance Measurement

- The implemented algorithm can be measured on a computer.
- Run time (CPU time) is the focus.
 - Compilation time is ignored.
- Algorithms with short run time should be repeated a number of times for more accurate run time measurement.
- Example algorithm to be measured.

Algorithm 1.3.13. Sequential Search

```
// Search for x in an array A of n elements.

// Input: A[1:n], x, int n>0

// Output: index i, A[i]=x, if not found i=0.

1 Algorithm SeqSearch(A,x,n) // A[0] is used as additional space.

2 {

3 i:=n; A[0]:=x; // initialization.

4 while (A[i] \neq x) do i:=i-1; // Search backward.

5 return i; // If not found, return 0.

6 }
```

Performance Measurement, II

Algorithm 1.3.14. Measuring Search Time

```
// To measure search CPU time with repetitions.
    // Input: None
   // Output: n, total time, average CPU time
 1 Algorithm TimeSearch()
 2 {
 3
          R[20] := \{ 2e7, 2e7, 1.5e7, 1e7, 1e7, 1e7, 5e6, 5e6, 5e6, 5e6, \frac{1}{\#Repetition} \}
                 5e6,5e6,5e6,5e6,5e6,5e6,2.5e6,2.5e6,2.5e6, 2.5e6 };
 4
          for j := 1 to 1000 do A[j] := j; // Init A[] = \{1, 2, 3, \dots, 1000\}.
          for j := 1 to 10 do \{ \ // \ \mathsf{Init} \ N[ \ ] = \{0, 10, 20, \dots, 90, 100, 200, \dots, 1000 \}
 6
 7
                 N[j] := 10 \times (j-1);
                 N[j+10] := 100 \times j;
 9
10
          for j := 2 to 20 do \{ // \text{ Set } n \text{ to be } N[2:20] \}
                 h := GetTime();
11
                for i := 1 to R[j] do // Repeat R[j] times for each n.
12
                       k := SeqSearch(A, 0, N[j]);
13
14
                t1 := GetTime() - h; t := t1/R[j];
                write (N[j], t1, t); // Write: n, total and average execution times.
15
          }
16
17 }
```

Performance Measurement, III

• The following function can get time of the day in seconds on linux systems.

Function 1.3.15. Get Time of Day

```
1 #include <sys/time.h>
2
3 double GetTime(void)
4 {
5     struct timeval tv;
6
7     gettimeofday(&tv, NULL);
8     return tv.tv_sec + 1e-6 * tv.tv_usec;
9 }
```

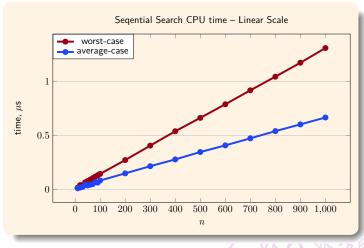

Algorithms (Analysis II)

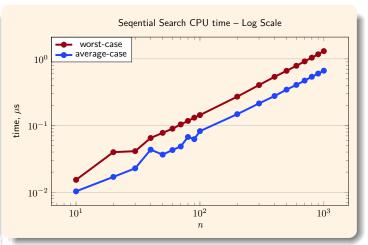

Unit 1.3 Analysis II

Mar. 17, 2020

19 / 22

Performance Measurement, IV

- ullet As n grows larger, the asymptotic behavior of the algorithm becomes more clear.
- Both worst-case and average-case complexities for the sequential search algorithm are $\mathcal{O}(n)$.
- In log scale plot, both lines have the same slope.
- For asymptotic complexity, the slope in log-scale plot is usually a better indicator.

Performance Measurement, V

- To measure the performance of an algorithm, the following factors should be considered
 - What is the resolution of the system clock?
 - What should be the number of repetitions for a meaningful measurement?
 - To measure worst-case or average-case performance?
 - For comparing two algorithms or to get the asymptotic complexity?
 - If the overhead in generating the test case should be deducted?
 - ullet For asymptotic analysis, least square fit for larger values of n should be used to get the complexity.
- Worst-case analysis should generate test cases that for each n the maximum amount of CPU time will be taken.
 - Can be approximated by using random test cases and take the maximum of the run time given an n.
- Average-case analysis should generate all possible test cases and then take the average.
 - Similar random-input-test-case approach can be taken for a quick approximation.
- ullet Best-case analysis is the minimum execution given the size n input.
- We are more interested in worst-case and average-case performance.
